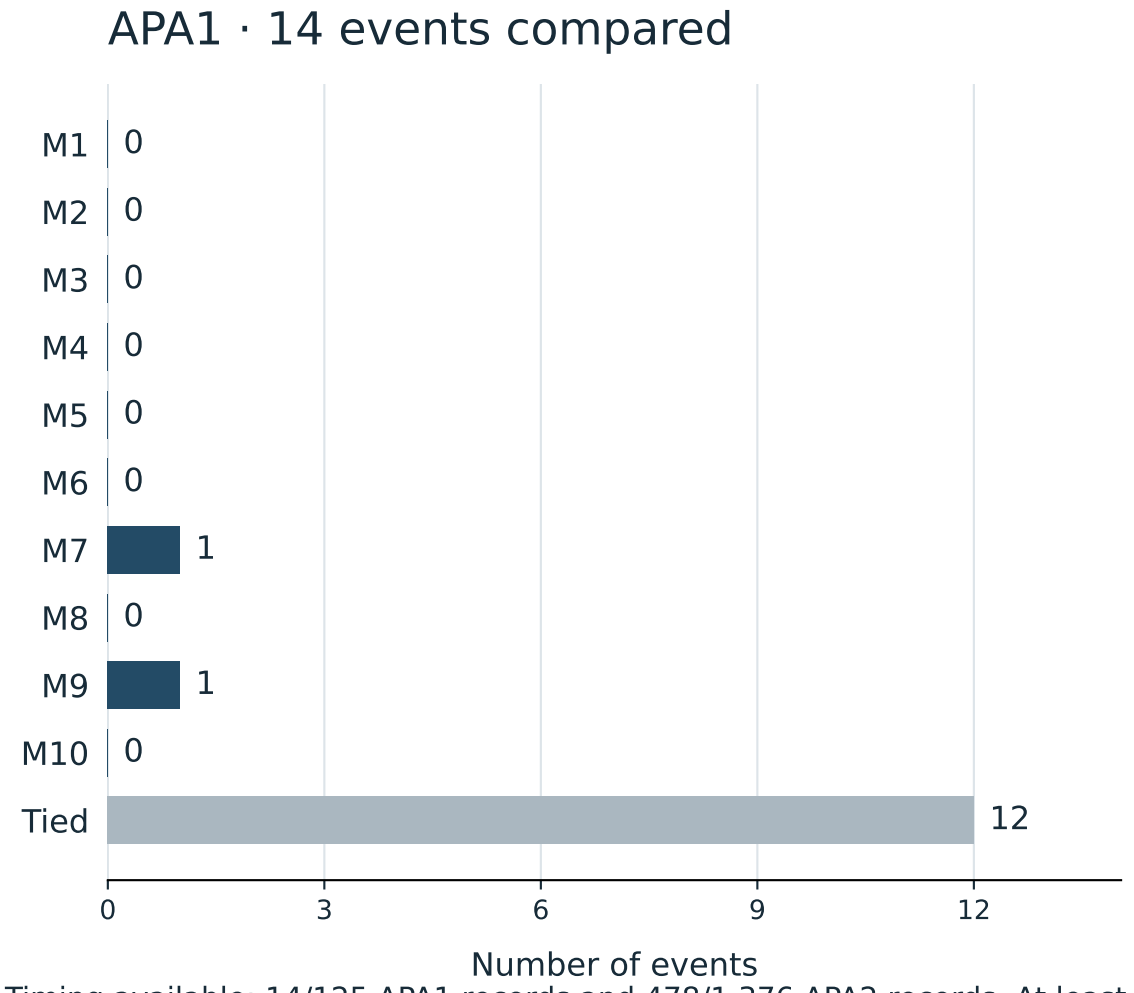
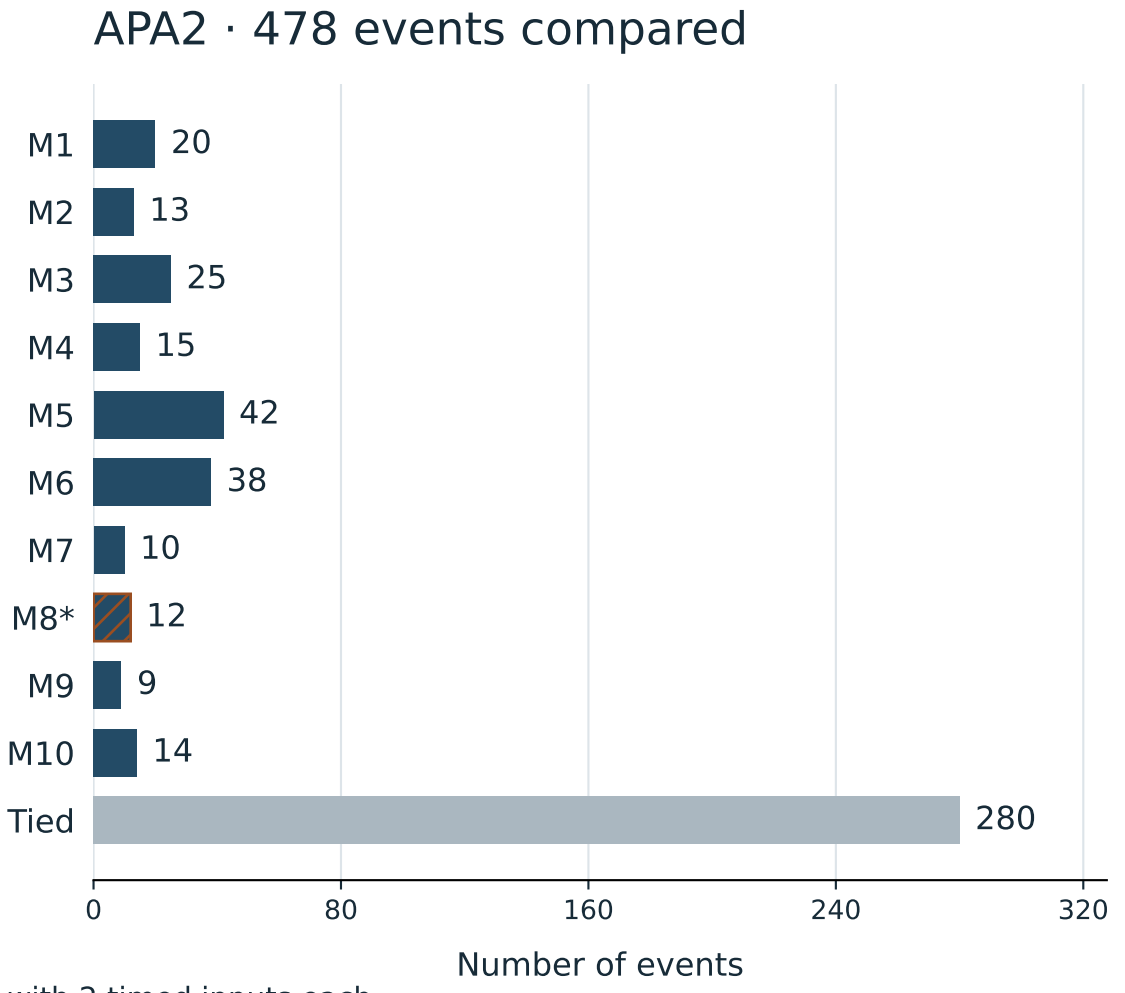
Which module starts the first early pulse?

Each event counts once. A module gets the event only when it leads the other timed modules by more than 16 ns.
Otherwise the event enters “Tied”. The comparison covers the first selected sharp pulse earlier than −100 µs.





Timing available: 14/125 APA1 records and 478/1,376 APA2 records. At least 4 modules with 2 timed inputs each.

Onset: sustained crossing of 20% of pulse depth, or the noise floor if larger. Missing modules do not count as later.

M8* in APA2 is disconnected; its recorded inputs are included for electrical behaviour. The APAs use different runs.

Native 16 ns samples. No cable/channel delay correction. These measured leads do not establish a physical source.
