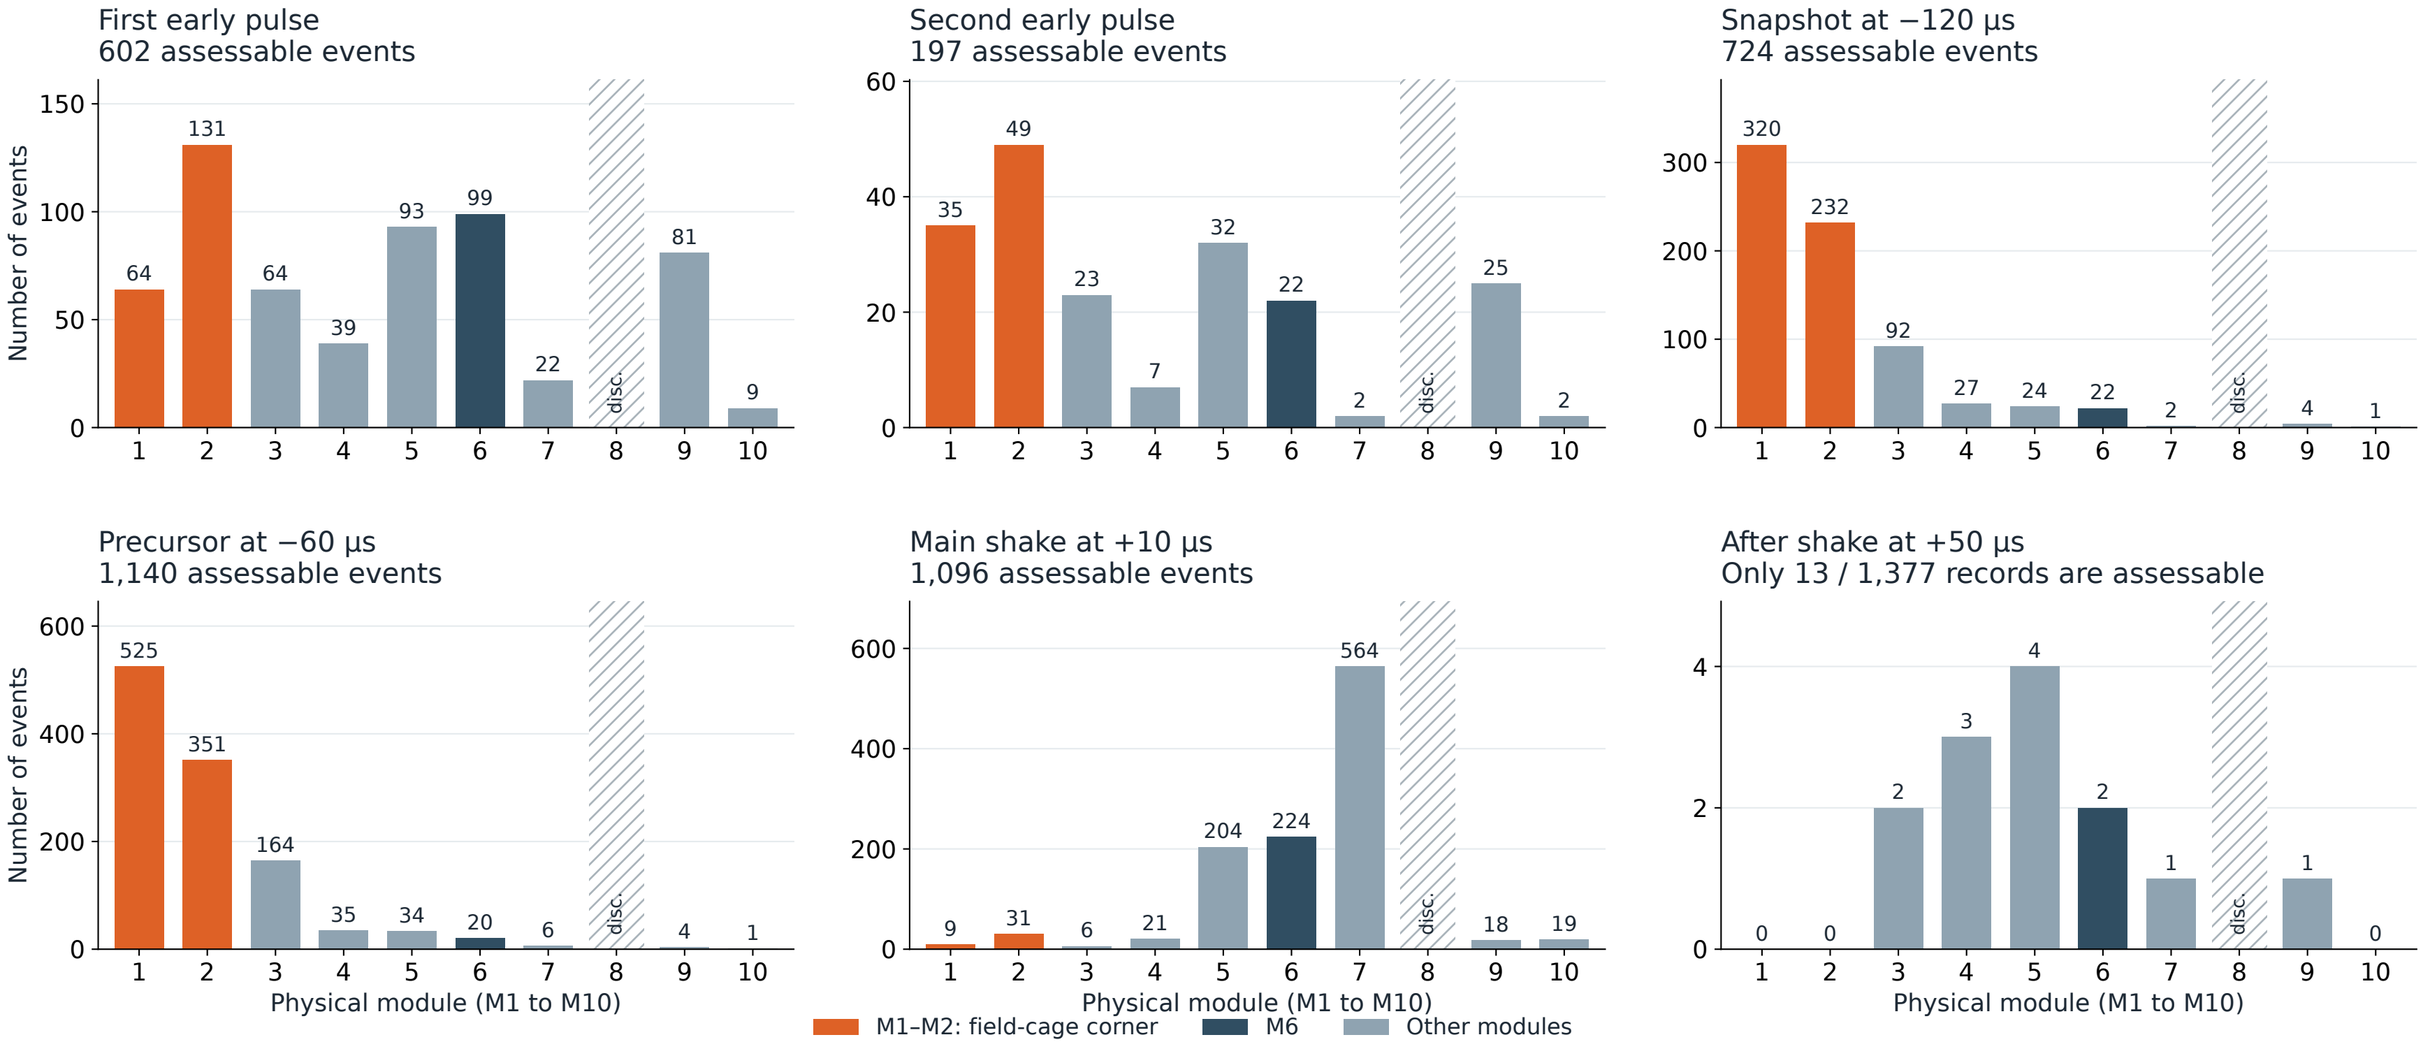
Where is the largest recorded PDS response?

All 1,377 available APA2 records with a main-shake time · One entry is one event with a clear largest module.



Taller bars mean more events. This measures the largest response, not the earliest onset or the amount of light.

Each stage can use different events. At least 12 recorded connected inputs across 4 modules; largest signal ≥20 ADC counts. Tied modules are omitted.

Early pulses: first two existing sharp candidates before −100 µs. Snapshots span 0.512 µs. M8 is reported disconnected; no missing sample is treated as zero.
